 JJ,

We like this idea. Can you please send an official note so we can use it as an official amendment. Also, The ODNR wants to see the results of the split samples before they will allow us full access to the Eisenbarth site. Is there any way that your sample analysis can be accelerated? I would be grateful for any help you can provide.

Good Afternoon Steve,

Thank you for your email. That sounds good but before selecting the ones below I have one suggestion I would like to bounce off of you. There are three rounds of sampling to be done of the sediments and water. Would you like to do one round of those and see what the current levels are in the sediments at those locations and then select the locations based off of more recent data, since the data we based these locations on is 9 months old?

Just an idea. Let me know what you think.

Thank you,

JJ Justice

JJ,

Statoil is good with forgoing NOELS or LOELS calculations and adding two additional locations for WST testing. Looking at our records on July 10, 2014 the SW06 (SE06) sampling location had a detection of 412 ug/kg of TTPC in sediment and on August 14, 2014, SW20 (SE20) had a TTPC detection of 644 ug/kg in sediment. These are the only TTPC detections in sediment that are within the requested range of sampling criteria you mentioned. Are you ok with these two sampling points? If you are, just send me a formal recommendation to your proposed changes and I will send back an affirmative response.
